

Chapter 8: Subnetting IP Networks

CCNA Routing and Switching

Introduction to Networks v6.0

Chapter 8 - Sections & Objectives

- 8.1 Subnetting an IPv4 Network
 - Implement an IPv4 addressing scheme to enable end-to-end connectivity in a small to medium-sized business network.
 - Explain how subnetting segments a network to enable better communication.
 - Explain how to calculate IPv4 subnets for a /24 prefix.
 - Explain how to calculate IPv4 subnets for a /16 and /8 prefix.
 - Given a set of requirements for subnetting, implement an IPv4 addressing scheme.
 - Explain how to create a flexible addressing scheme using variable length subnet masking (VLSM).
- 8.2 Addressing Schemes
 - Given a set of requirements, implement a VLSM addressing scheme to provide connectivity to end users in a small to medium-sized network.
 - Implement a VLSM addressing scheme.

Chapter 8 - Sections & Objectives (Cont.)

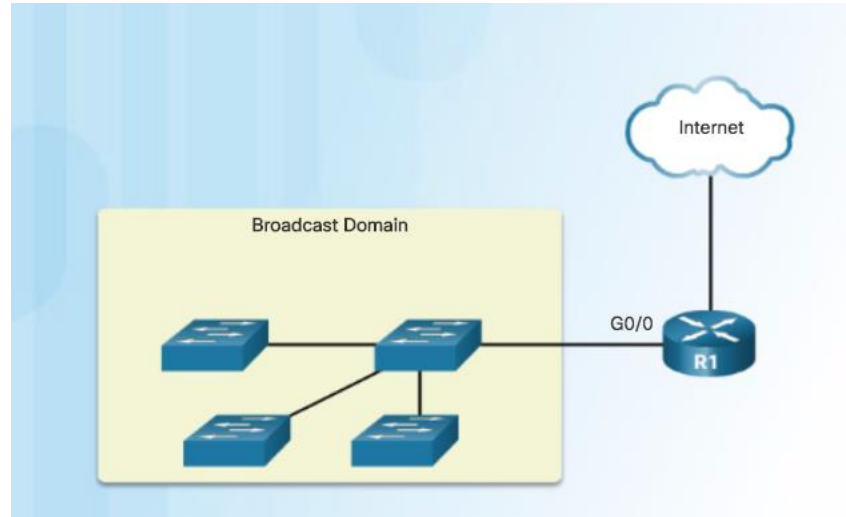

- 8.3 Address Schemes
 - Explain design considerations for implementing IPv6 in a business network.
 - Explain how to implement IPv6 address assignments in a business network.

8.1 Subnetting an IPv4 Network

Network Segmentation

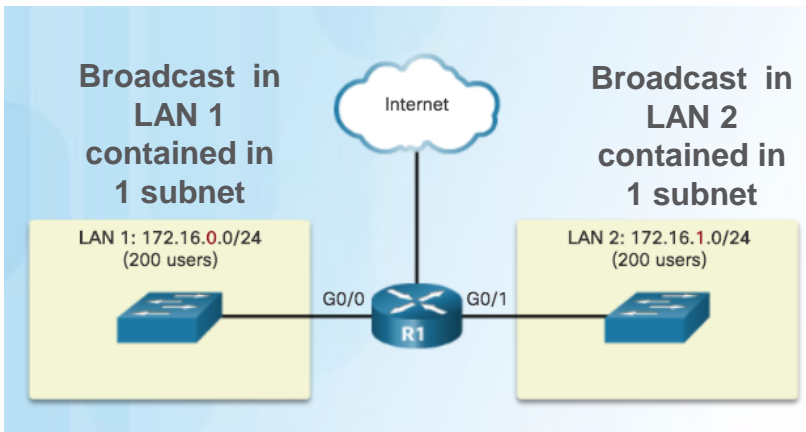

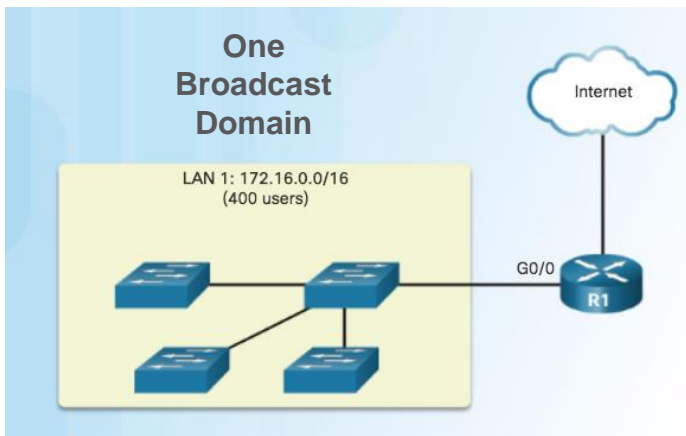

Broadcast Domains

- Devices use broadcasts in an Ethernet LAN to locate:
 - **Other devices** - Address Resolution Protocol (ARP) which sends Layer 2 broadcasts to a known IPv4 address on the local network to discover the associated MAC address.
 - **Services** – Dynamic Host Configuration Protocol (DHCP) which sends broadcasts on the local network to locate a DHCP server.
- Switches propagate broadcasts out all interfaces except the interface on which it was received.

Problems with Large Broadcast Domains

- Hosts can generate excessive broadcasts and negatively affect the network.
 - Slow network operations due to the significant amount of traffic it can cause.
 - Slow device operations because a device must accept and process each broadcast packet.
- Solution: Reduce the size of the network to create smaller broadcast domains. These smaller network spaces are called *subnets*.

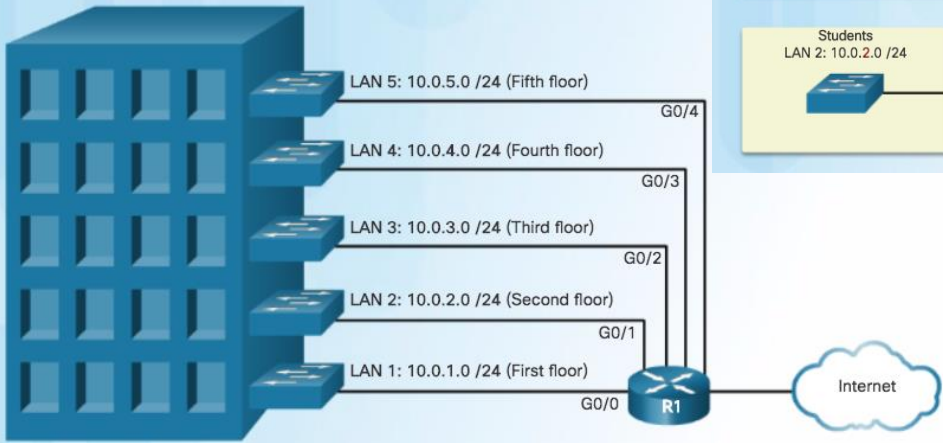

Network Segmentation

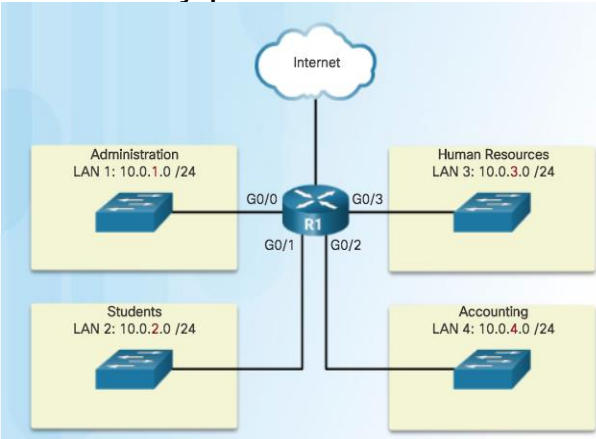

Reasons for Subnetting

- Reduces overall network traffic and improves network performance.
- Enables an administrator to implement security policies such as which subnets are allowed or not allowed to communicate together.

Subnetting by Location

Communicating between Networks

Subnetting by Device Type

Subnetting an IPv4 Network

Octet Boundaries

Networks are most easily subnetted at the octet boundary of /8, /16, and /24

Prefix Length	Subnet Mask	Subnet Mask in Binary (n = network, h = host)	# of hosts
/8	255.0.0.0	<code>nnnnnnnn . hhhhhhhh . hhhhhhhh . hhhhhhhh</code> <code>11111111 . 00000000 . 00000000 . 00000000</code>	16,777,214
/16	255.255.0.0	<code>nnnnnnnn . nnnnnnnn . hhhhhhhh . hhhhhhhh</code> <code>11111111 . 11111111 . 00000000 . 00000000</code>	65,534
/24	255.255.255.0	<code>nnnnnnnn . nnnnnnnn . nnnnnnnn . hhhhhhhh</code> <code>11111111 . 11111111 . 11111111 . 00000000</code>	254

- Prefix length and the subnet mask are different ways of identifying the network portion of an address.
- Subnets are created by borrowing host bits for network bits.
- More host bits borrowed, the more subnets that can be defined.

- Subnetting Network 10.x.0.0/16
- Define up to 256 subnets with each subnet capable of connecting 65,534 hosts.
- First two octets identify the network portion while the last two octets are for host IP addresses.

- Subnetting Network 10.x.x.0/24
- Define 65,536 subnets each capable of connecting 254 hosts.
- /24 boundary is very popular in subnetting because of number of hosts.

Subnets can borrow bits from *any* host bit position to create other masks.

Video Demonstration – The Subnet Mask

Subnetting in Binary

- ANDING
 - Convert IP address and Subnet Mask to Binary (line up vertically like an addition problem)
 - Logically AND (1 and 1 = 1, all other combinations = 0)
 - Result is network address for original IP address
- Classful Subnetting
 - Class A /8 255.0.0.0
 - Class B /16 255.255.0.0

Benefits of Variable Length Subnet Masking

Video Demonstration – VLSM Basics

- Basic VLSM
 - Subnets do not have to be equal sizes, as long as their address ranges do not overlap.
 - When creating subnets it is easier to work from larger to smaller.

Benefits of Variable Length Subnet Masking

Video Demonstration – VLSM Example

- Given the network 172.16.0.0 /23 creates subnets:
 - 1 network for 200 hosts - 256
 - 1 network for 100 hosts - 128
 - 1 network for 50 hosts - 64
 - 1 network for 25 hosts - 32
 - 1 network for 10 hosts - 16
 - 4 point-to-point networks for 2 hosts each – 4x4 = 16

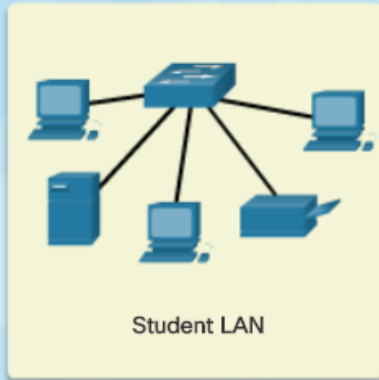

$/23 = 2^9$ hosts = 512
 $256+128+64+32+16+16 = 512$ hosts needed
Address range 172.16.0.0 – 172.16.1.255

8.2 Addressing Schemes

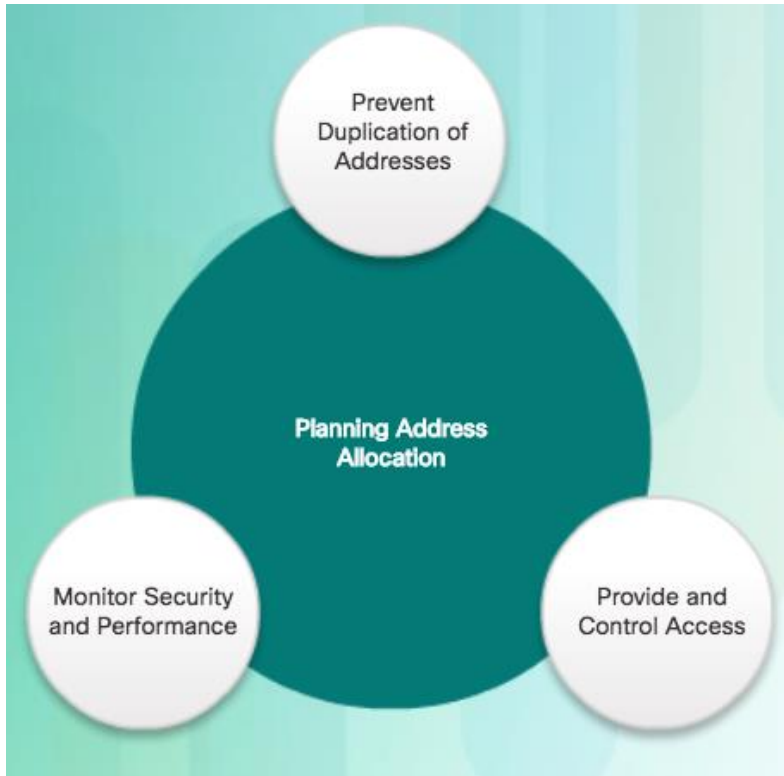

Network Address Planning

Planning IP Address Assignment

Planning requires decisions on each subnet in terms of size, the number of hosts per subnet, and how host addresses will be assigned.

Planning to Address the Network

- Each host in an internetwork must have a unique address.
- Need proper planning & documentation.
- Must provide & control access to servers from internal hosts and external hosts.
- Layer 3 STATIC address assigned to a server can be used to control access to that server.
- Monitoring security and performance of hosts means network traffic is examined for source IP addresses that are generating or receiving excessive packets.

Assigning Addresses to Devices

- Devices that require addresses:
 - **End user clients**
 - Can be set for DHCP to save time and manual errors.
 - A change in the subnetting scheme requires reconfiguration of DHCP server. IPv6 clients use DHCPv6/SLAAC.
 - **Servers**
 - Configured with static addresses.
 - Private addresses translated to public addresses if accessible from the Internet.
 - **Intermediary devices**
 - Set with static addresses for remote management.
 - **Gateway**
 - Router interface used to exit the network.

Host Devices	.1	.229
Servers	.230	.239
Printers	.240	.249
Intermediary Devices	.250	.253
Gateway (router LAN interface)	.254	

8.3 Design Considerations for IPv6

The IPv6 Global Unicast Address

- IPv6 subnetting is not concerned with conserving address space.
- IPv6 subnetting is about building an addressing hierarchy based on the number of subnetworks needed.
- IPv6 link-local address is never subnetted.
- IPv6 global unicast address can be subnetted.
- IPv6 global unicast address normally consists of a /48 global routing prefix, a 16 bit subnet ID, and a 64 bit interface ID.

Structure

Global Routing Prefix

This is the prefix, or network, portion of the address that is assigned by the provider. Typically, Regional Internet Registries (RIRs) assign a /48 global routing prefix to ISPs and customers.

8.4 Chapter Summary

Chapter 8: Subnetting IP Networks

- Implement an IPv4 addressing scheme to enable end-to-end connectivity in a small to medium-sized business network.
- Given a set of requirements, implement a VLSM addressing scheme to provide connectivity to end users in a small to medium-sized network.
- Explain design considerations for implementing IPv6 in a business network.
